AMENDMENTS TO THE CLAIMS

Please cancel claims 1-7, and add new claims 8-14, as follows:

Claims 1 - 7 (canceled)

8. (New) An organic electroluminescent display, comprising:

(a) an organic light-emitting device including, in the recited sequence,

a substrate,

thin film transistors that each have a source and a drain,

anodes or cathodes that include an electrically conductive thin film material and are each connected to the source or the drain on a corresponding one of the thin film transistors,

an organic electroluminescent light-emitting layer,

an upper transparent electrode that is a cathode or anode and includes a transparent electrically conductive material, and

at least one passivation layer on the upper transparent electrode,

and which is driven by the thin film transistors;

(b) a color-converting substrate that comprises

a transparent supporting substrate, and

color-converting filters that comprise color filter layers alone, or color filter layers and color-converting layers, and are formed on the supporting substrate;

(c) an adhesive layer that disposed is between the organic light-emitting device and the color-converting filters, and that bonds the organic light-emitting device and the color-converting filters together with the color-converting filters facing the upper transparent electrode of the organic light-emitting device; and

(d) a stress-relieving layer that is disposed between the organic light-emitting device and the color-converting filters, and at edges of the color-converting filters.

9. (New) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer includes a resin having a higher elasticity than the adhesive layer.

10. (New) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer has a lower refractive index than the adhesive layer.

11. (New) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer has a reverse tapered shape relative to the color filter layers alone, or the color filter layers and the color-converting layers, of the color-converting filters.

12. (New) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer is black.

13. (New) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer is an efficient thermal conductor.

14. (New) The organic electroluminescent display according to claim 13, wherein the stress-relieving layer is formed from a polymeric material having an efficient thermal conductor dispersed therein.
